

More West Nile Virus Detected in Oxford

Another sample of *Culex* mosquitoes collected from Oxford Township has tested positive for West Nile Virus. The mosquito sample was collected from area near the sewer plant on Pequest Road in Oxford. The mosquitoes were collected on July 6, 2017 in a trap specifically designed to catch *Culex* mosquitoes, which are the type responsible for transmitting West Nile virus, particularly from bird to bird. This sample of mosquitoes was sent to the state Public Health and Environmental Lab in Trenton on Monday July 10, 2017.

July is the usual time to see increased West Nile virus activity in mosquito populations. Mid to late August is peak time for humans and other mammals to acquire this virus. No people in NJ have tested positive for WNV yet this year. Subsequent trapping for adult mosquitoes is taking place to survey for mosquito species more likely to bite people. **Treatments to reduce adult mosquito populations in that area (Lower Denmark Road and Pequest Road) are pending proper notification and weather conditions but are tentatively planned for Thursday, July 13 or Saturday July 15, 2017.**

Residents are urged to help reduce their risk of contracting mosquito-borne diseases by following these guidelines:

- Don't produce mosquitoes on your property. **Dump** or **drain** standing water. Mosquitoes can't begin their life without water.
- **Defend** yourself against mosquitoes using repellents containing DEET, Picaridin, or Oil of Lemon Eucalyptus.
- Avoid being outdoors when mosquitoes are present, typically **Dawn** and **Dusk**.
- **Report neglected swimming pools** by calling 908-453-3585 or visiting www.warrencountymosquito.org *Anonymous calls accepted*. Just one neglected pool can produce more than **1 million** mosquitoes and affect people up to **five miles** away.

WEST NILE VIRUS INFORMATION

West Nile virus symptoms of the mild form include fever, headache, tiredness, body aches, and swollen lymph glands. While the illness can be as short as a few days, even healthy people have reported being sick for several weeks.

Less than one percent of individuals (about 1 in 150 people) infected with West Nile virus will develop severe illness. The severe symptoms can include high fever, headache, neck stiffness, stupor, disorientation, coma, tremors, convulsions, muscle weakness, vision loss, numbness and paralysis. These symptoms may last several weeks, and neurological effects may be permanent. West Nile virus infection can be fatal.
